Coat Type

Trait	Genotype	Description
Coat Length	I/I	The dog is genetically long-haired.
Furnishings / Improper Coat in Portuguese Water Dogs (marker test)	AG/TC	The dog is likely genetically heterozygous at the furnishings locus, but may express the phenotype.
Curly coat	C/C	The dog is genetically non-curly.

Coat Color

Trait	Genotype	Description
Color Locus E - Extensions	e/e	The dog has recessive red coat color.
Color Locus B - Brown	B/B || B/bd || bd/bd	The dog doesn't have any of the tested b alleles causing brown color.
Color Locus K - Dominant Black	KB/ky || kbr/ky || kbr/kbr	The dog is genetically dominant black or brindle.
Color Locus A - Agouti	at/at	The dog has genetically tan points or saddle tan pattern.
Color Locus S - Piebald or extreme white spotting	S/S	The dog is likely to have solid coat color with minimal white.
Color Locus H - Harlequin	h/h	The dog doesn't have harlequin pattern.
Color Locus C - Albinism (c^{aL}-allele)	C/C	This dog does not carry the tested mutation for albinism.
Color Pattern (RALY gene): Saddle Tan	dup/dup	The dog may have tan points if it has tan point genotype at the A locus.

Test results - Traits - page 3

Body Size

Trait	Genotype	Description
Body mass, insulin-like growth factor 1 (IGF1) gene variant	A/A	The dog is homozygous for the derived allele typically associated with small body mass.
Tiny size, insulin-like growth factor 1 receptor (IGF1R) gene variant	G/G	The dog carries two ancestral alleles typically found in larger-sized breeds.
Chondrodysplasia; breed-defining trait	D/D	The dog is homozygous for the ancient allele. The dog is likely to have legs of normal length.
Body size, STC2 gene variant chr4:39182836	T/T	The dog has two copies of the ancestral allele associated with larger body size.
Body size, GHR1 gene variant E191K	A/G	The dog carries one ancestral allele and one derived allele.
Body size, GHR2 gene variant P177L	C/C	The dog has two copies of the ancestral allele associated with larger body size.
Body size, HMGA2 gene variant	A/G	Your dog carries one copy of the derived allele and one copy of the ancestral allele. The dog may have a bit smaller size.

Test results - Traits - page 4

Morphology

Trait	Genotype	Description
Snout/skull length (shortened head versus elongated head), bone morphogenetic protein 3 (BMP3) gene variant	A/C	Your dog is heterozygous for this variant. This means that your dog carries one copy of a genetic variant typically associated with an elongated head, and one copy typically associated with a shortened head.
Ear erectness (pricked ears versus floppy ears), variant chr10:11072007	C/T	The dog is heterozygous for this variant. This means that it carries one copy of a genetic variant typically associated with floppy ears and one copy typically associated with pricked ears. Such variation is seen in many breeds, like Golden Retriever, Labrador Retriever, and Finnish Hound.
Bobtail	C/C	The dog does not carry any copy of the bobtail mutation. It therefore likely has a long-tailed phenotype.

APPENDIX
Explanation of the results of the tested disorders

Autosomal recessive inheritance (ARI)

Clear - A dog carries no copies of the tested mutation and has no or reduced likelihood of developing and passing on the disease/condition.
Carrier - A dog carries one copy of the tested mutation. Carriers typically have a normal, healthy appearance but pass on the mutation to approximately 50% of their offspring.
At risk - A dog carries two copies of the tested mutation and is at high or increased risk of developing the disease/condition.

Autosomal dominant inheritance (ADI)

Clear - A dog carries no copies of the tested mutation and has no or reduced likelihood of developing and passing on the disease/condition.
At risk - A dog carries one or two copies of the tested mutation and is at high or increased risk of developing the disease/condition.

X-linked recessive inheritance (X-linked)

Clear - A dog carries no copies of the tested mutation and has no or reduced likelihood of developing and passing on the disease/condition.
Carrier - Female carriers typically have a normal, healthy appearance but carry one copy of the tested mutation on one of their X chromosomes. As males only have one X chromosome, there are no male carriers.
At risk - Female dogs at risk carry two mutated copies of the tested mutation. Males carry one copy of the tested mutation on their single X chromosome. Dogs at risk are at high or increased risk of developing the disease/condition.

Please note that the descriptions above are generalized based on typically observed inheritance patterns. When obtaining a 'carrier' or 'at risk' test result, always refer to the corresponding online test documentation for more detailed information on the condition and any exceptions.

Optimal Selection™

Hilltop Pups Snookie, Mixed breed

OPTIMAL SELECTION™ DNA TEST TERMS AND CONDITIONS

Optimal Selection™ Genetic Breeding Analysis is a proprietary process designed and intended to be used on purebred dogs solely to 1) Help quantify the genetic compatibility of potential breeding pairs and 2) To identify specific alleles or DNA mutations that are associated with certain inherited diseases or traits. No other purpose is authorized or permitted. It is not intended to diagnose diseases or predict behavior in any particular dog.

Upon receipt of your dog's DNA sample, Mars Veterinary will analyze your dog's DNA to determine chromosomal similarities and differences in the genetic profile of a potential sire and dam and provide a match analysis. Your dog's DNA will also be analyzed for the presence of specific alleles that are associated with inherited conditions identified as occurring in your dog's breed. Mars Veterinary's testing procedures are designed to provide reliable and accurate results, but are not guaranteed. By submitting your dog's sample(s) for Optimal Selection™ analysis it is understood that you agree that the sample(s), analysis, results and related information may be used confidentially by Mars in conjunction with other samples to increase the understanding of the breed's genetic structure, as well as for internal, research and development, or statistical purposes and may be shared with third parties for these purposes.

Samples may be disposed of or stored at Mars Veterinary's option and will not be returned. Please view the full Mars Privacy Policy here: http://www.mars.com/global/policies/privacy/pp-english.aspx It is also understood that future releases of the Optimal Selection™ test may refine results as more information is obtained regarding the breed structure and/or if new genetic markers are included.

Optimal Selection™ genetic assessments for individual dogs and potential mates will be available online to the person(s) who registered the sample. A dog's results, photo and other information may be shared by the owner with other individuals whom they choose or transferred to a new owner if the dog changes ownership. The content of such online services 1) may be altered due to changes, additions, or removals of a dog's information in the Optimal Selection™ database or due to changes in technical or other design of such services and 2) includes information about third parties and other Mars Veterinary clients' dogs, which Mars Veterinary is not responsible or liable for. Mars Veterinary has right to terminate access to online services one year from the purchase date, unless a longer period has been agreed upon.

You agree to Mars Veterinary instructions related to ordering process, payment, sampling and sample delivery. You also certify that the animal described in your order is the same animal whose sample is submitted for analysis, and that all information is accurate. You warrant that you are entitled to obtain and supply samples to Mars Veterinary.

In the unlikely event that it is not possible to provide an analysis (for example due to an insufficient DNA sample) or that an error in the analysis occurs, liability by Mars Veterinary or related companies and individuals is disclaimed and damages in any event are limited to the payment actually received by Mars Veterinary for the specified analysis at issue. Mars Veterinary's study of the complexities of the canine genome is ongoing with the goal of continuing to provide the most advanced and complete analysis possible.

Mars Veterinary reserves the right to use any third party of its choice to undertake the testing, analysis or laboratory services for the analysis.
